## ABSTRACT

This invention presents a method and system for persistent session and data control across transparently distributed objects. Persistent data control enables a system to reconnect

5   users to the appropriate data areas after a system fault. Persistent session control enables a user to reestablish the state of a previous session with the data, regardless of intervening outages at any one or many parts of the network. The invention uses persistent data objects and persistent data control objects to create persistent sessions and data control across the network.
